Introduction to Gojee Templates

Last updated on May 11th, 2023

Introduction

Templates in Gojee are a pre-defined collection of resources (any combination of inventory, professions and assets) and can also include other templates (i.e., nested templates).

Templates can be used to define a set of requirements that frequently get used in your jobs so you can add just one line onto the job, instead of all the items individually.

Templates can also be customised on the job without updating the source template to create fully flexible use of these pre-defined resources.

Catalogue template costs will be updated automatically based off changes in the component costs (i.e. the price of an item changes due to recent purchasing etc.). You can set the price of the template to be driven off costs to ensure that you're always maintaining suitable margins.
